ARIANESPACE'S ARIANE 5 LAUNCH FOR THE GALILEO CONSTELLATION AND EUROPE

For its fourth launch of the year, Arianespace will orbit four more satellites (satellites 23 to 26) for the Galileo constellation. This mission is being performed on behalf of the European Commission under a contract with the European Space Agency (ESA).

For the third time, an Ariane 5 ES version will be used to orbit satellites in Europe's own satellite navigation system; with all Galileo spacecraft having been launched to date by Arianespace. Ariane 6 will take over from 2020.

Arianespace is proud to mobilize its entire family of launch vehicles for the benefit of Europe's ambitions and its independent access to space.

Galileo, an ambitious program serving Europe's and the world's citizens

Galileo is Europe's own global navigation satellite system, providing a highly accurate, guaranteed global positioning service under civilian control. Currently providing Initial Services, Galileo is interoperable with GPS and Glonass, the U.S. and Russian global satellite navigation systems. By offering dual frequencies as standard, Galileo is set to deliver real-time positioning accuracy down to the meter range.

The constellation will count 24 operational satellites plus in-orbit spares, of which 22 already have been put into orbit by Arianespace.

In July 2017, ESA officially transferred the supervision of Galileo in-orbit operations to the European Global Navigation Satellite Systems Agency (GSA), on behalf of the European Union.

After the VA244 launch, the GSA will be responsible for operating the satellites as soon as they are separated from the launcher. These operations of setting up and operating the system will be done in collaboration with ESA.

THE ARIANESPACE FAMILY: SUPPORTING THE DEPLOYMENT OF GALILEO

Arianespace orbited the Galileo IOV 1 and 2 (In-Orbit Validation) satellites on Soyuz Flight VS01 on October 21, 2011, followed by IOV 3 and 4 on Flight VS03 on October 12, 2012. Under European Space Agency-European Union co-financing, this phase allowed validation of the overall concept.

Previously, the ESA GIOVE-A and GIOVE-B experimental satellites were orbited by Soyuz from the Baikonur Cosmodrome in Kazakhstan (via Arianespace's Starsem affiliate) in 2005 and 2008.

The first two Full Operational Capability (FOC) satellites for Galileo (Sats 5 and 6) were launched on August 22, 2014. From 2015 to 2016, the Galileo Sats 7 to 22 were deployed by Arianespace Flights VS11, VS12, VS13, VS15, all via Soyuz; and VA233 and VA240, via launches of Ariane 5 ES versions.

Arianespace will deploy Galileo FOC-M8 satellites 23 to 26 on the third and final dedicated Ariane 5 ES mission in support of the navigation system.

The Ariane 6's A62 version will take over, with two launches used to orbit another four satellites during a timeframe between December 2020 and June 2021.

The Flight VA244 mission will be Arianespace's 49th performed for ESA. Arianespace has seven more ESA missions in its launch manifest: two for the European Commission, carrying four Galileo spacecraft; and five other missions (to orbit EDRS-C, Bepi-Colombo, the James Webb Space Telescope, CHEOPS and ADM-Aeolus).

These launches clearly show that Arianespace is meeting its assigned mission of ensuring independent access to space for Europe.

MISSION DESCRIPTION

The third Arianespace Ariane 5 launch of 2018 will place the four Galileo satellites into MEO (Medium Earth Orbit) circular orbit.

The launcher will be carrying a total payload of approximately 3,379 kg.

The launch will be performed from Ariane Launch Complex No. 3 (ELA 3) in Kourou, French Guiana.

DATE AND TIME

Liftoff is planned on **Wednesday, July 25, 2018** at exactly:

- > 8:25:01 a.m., Kourou time
- > 7:25:01 a.m., Washington D.C. time
- > 11:25:01, Universal Time (UTC)
- > 1:25:01 p.m., Paris time

MISSION DURATION

The nominal duration of the mission (from liftoff to separation of the satellites) is:

3 hours, 56 minutes and 54 seconds.

TARGETED ORBIT

Circular orbit
MEO-plane B.

Altitude
22,922 km.
Semi-major axis: 29,300 km.

Inclination
56.00 degrees

THE LAUNCH AT A GLANCE

The launcher's attitude and trajectory are controlled by the two onboard computers, located in the Ariane 5 Vehicle Equipment Bay (VEB).

About seven seconds after start of the ignition of the main stage cryogenic engine at T-0, the two solid-propellant boosters are ignited, enabling liftoff. The launcher first climbs vertically for six seconds, then rotates towards the East. It maintains an attitude that ensures the axis of the launcher remains parallel to its velocity vector, in order to minimize aerodynamic loads throughout the entire atmospheric phase until the solid boosters are jettisoned.

The fairing protecting the payload is jettisoned at T+225 seconds.

The flight of the Ariane 5 lower composite, comprising the two solid boosters and the cryogenic main stage, will last about nine minutes. This stage then separates from the upper stage and falls back into the Pacific Ocean, off the coast of Peru.

The storable propellant upper stage will ignite its own engine at this point, to bring the upper composite - comprising the Galileo satellites and their dispenser - into a transfer orbit. Following this initial ignition, the upper composite is spun up for a ballistic phase lasting 3 hours, 8 minutes.

At a predetermined point in this orbit, the upper stage will again ignite its engine for a little more than six minutes, to reach a circular separation orbit. Once stabilized, the dispenser will release the first two satellites, followed by the second pair 20 minutes later.

The upper stage will be passivated at the end of the mission. The Galileo satellites will then perform a maneuver to increase their altitude and reach the operational orbit at 23,222 km.

At orbital injection, the launcher will have attained a velocity of approximately 3,000 meters/second, and will be at an altitude of 22,922 kilometers, which is 300 km. below Galileo's operational orbit.

PAYLOAD CONFIGURATION

> Payload: **Galileo FOC-M8, SAT 23, 24, 25, 26**

Mass at liftoff: 738 kg. each, for a total of 2,952 kg.

> Medium version of the payload fairing

> Dispenser (carrying structure and deployment system) for the four Galileo FOC-M8 payloads, developed and built by ArianeGroup.

| Wednesday, July 11, 2018 | Integration of the four Galileo satellites on the launcher | |
| Thursday, July 12, 2018 | Encapsulation of the four Galileo satellites in the payload fairing | |
| Monday, July 16, 2018 | | N2H4 fueling of SCA; SCA pressurization for launch |
| Tuesday, July 17, 2018 | | MMH fueling of EPS |
| Wednesday, July 18, 2018 | | Launch rehearsal N2H4 fueling of EPS |
| Thursday, July 19, 2018 | | Arming of the launch vehicle |
| Friday, July 20, 2018 | | Launch readiness review (RAL); final preparation of launcher and BAF for the chronology |
| Monday, July 23, 2018 | | Rollout from the BAF to Launch Zone; launch vehicle connections |
| Tuesday, July 24, 2018 | | Filling of the EPC liquid helium tank; Heating of EPS tank |
| Wednesday, July 25, 2018 | | Final launch countdown; EPC filling with liquid oxygen and liquid hydrogen |

VA244

Galileo FOC-M8
SAT 23-24-25-26

COUNTDOWN AND FLIGHT SEQUENCE

The countdown comprises all final preparation steps for the launcher, the satellites/spacecraft and the launch site. If it proceeds as planned, the countdown leads to ignition of the main stage engine, then the two boosters, for a liftoff at the targeted time.

The countdown culminates in a synchronized sequence, which is managed by the control station and onboard computers starting at T-7 minutes.

If an interruption in the countdown results in the T-0 moving outside the launch time, then the launch will be delayed by one, two or more days, depending on the problem involved, and the solution developed.

| TIME | EVENT |
|--------------------|---|
| - 11 h 38 min | Start of final countdown |
| - 10 h 53 min | Check of electrical systems |
| - 04 h 38 min | Start of filling of the EPC with liquid oxygen and hydrogen |
| - 03 h 18 min | Chiltdown of Vulcain main stage engine |
| - 01 h 10 min | Check of connections between launcher and the telemetry, tracking and command systems |
| - 7 min | "All systems go" report, allowing start of synchronized sequence |
| - 4 min | Tanks pressurized for flight |
| -1 min | Switch to onboard power mode |
| - 04 s | Onboard systems take over |
| T-O | Ignition of the cryogenic main stage engine (EPC) |
| + 07 s | Ignition of solid boosters (EAP) |
| + 07 s | Liftoff |
| + 12 s | End of vertical climb, beginning of pitch motion |
| + 17 s | Beginning of roll maneuver |
| + 2 min 19 s | EAP separation |
| + 3 min 44 s | Fairing jettisoned |
| + 8 min 56 s | End of EPC thrust phase |
| + 9 min 01 s | EPC separation |
| + 9 min 19 s | EPS ignition |
| + 19 min 58 s | Shutdown of EPS (first boost) and beginning of the first ballistic phase |
| + 3h + 27 min 50 s | EPS ignition |
| + 3h + 34 min 08 s | Shutdown of EPS (second boost) and beginning of the second ballistic phase |
| + 3h + 36 min 05 s | Separation of Galileo satellites 23 and 25 |
| + 3h + 56 min 05 s | Separation of Galileo satellites 24 and 26 |
| + 4h + 12min 59 s | Upper stage passivation |
| + 4h + 40min 52 s | End of the Arianespace mission |

VA244

Galileo FOC-M8
SAT 23-24-25-26

ARIANE 5 ES MISSION PROFILE

The launcher's attitude and trajectory are entirely controlled by the two onboard computers in the Ariane 5 Vehicle Equipment Bay (VEB).

The synchronized sequence starts seven minutes before ignition (T-0). It is primarily designed to perform the final operations on the launcher prior to launch, along with the ultimate checks needed following switchover to flight configuration. As its name indicates, the sequence is fully automatic, and is performed concurrently by the onboard computer and by two redundant computers at the ELA-3 launch complex until T-4 seconds. The computers command the final electrical operations (startup of the flight program, servocontrols, switching from ground power supply to onboard batteries, etc.) and associated checks. They also place the propellant and fluid systems in flight configuration and perform associated checks. In addition, they handle the final ground system configurations, namely:

- > Startup of water injection in the flame trenches and exhaust guide (T-30 sec).
- > Hydrogen aspiration for chilldown of the Vulcain engine in the exhaust guide (T-18 sec).
- > Burnoff of hydrogen used for chilldown (T-5.5 sec).

At T-4 seconds, the onboard computer takes over control of final engine startup and liftoff operations. It:

- > Starts the ignition sequence for the Vulcain main stage engine (T-0).
- > Checks engine operation (from T+4.5 to T+6.9 sec).
- > Commands ignition for the solid boosters at T+7.05 sec for liftoff at T+7.3 seconds.

Any shutdown of the synchronized sequence after T-7 minutes automatically places the launcher back in its T-7 minute configuration.

ARIANESPACE AND THE GUIANA SPACE CENTER

ARIANESPACE, THE WORLD'S FIRST LAUNCH SERVICES COMPANY

Arianespace was founded in 1980 as the world's first launch Services & Solutions company. Arianespace is a subsidiary of ArianeGroup, which holds 74% of its share capital; the balance is held by 17 other shareholders from the European launcher industry.

Since the outset, Arianespace has signed over 530 launch contracts and launched 570-plus satellites. More than half of the commercial satellites now in service around the globe were launched by Arianespace. The company posted sales of approximately 1.3 billion euros in 2017.

The company's activities are worldwide, with the headquarters in Evry, France (near Paris); the Guiana Space Center in French Guiana, where the Ariane, Soyuz and Vega launch pads are located; and offices in Washington, D.C., Tokyo and Singapore. Arianespace offers launch services to satellite operators from around the world, including private companies and government agencies. These services call on three launch vehicles:

- > The Ariane 5 heavy-lift launcher, operated from the Guiana Space Center in French Guiana.
- > The Soyuz medium-lift launcher, currently in operation at the Guiana Space Center and the Baikonur Cosmodrome in Kazakhstan.
- > The Vega light-lift launcher, also operated from the Guiana Space Center.

Building on its complete family of launchers, Arianespace has won over half of the commercial launch contracts up for bid worldwide in the past two years. Arianespace now has a backlog of more than 70 satellites to be launched.

THE GUIANA SPACE CENTER: EUROPE'S SPACEPORT

For more than 40 years, the Guiana Space Center (CSG), Europe's Spaceport in French Guiana, has offered a complete array of facilities for rocket launches. It primarily comprises the following:

- > The CNES/CSG technical center, including various resources and facilities that are critical to launch base operations, such as radars, telecom network, weather station, receiving sites for launcher telemetry, etc.
- > Payload processing facilities (EPCU), in particular the S5 facility.
- > Ariane, Soyuz and Vega launch complexes, comprising the launch zones and launcher integration buildings.
- > Various industrial facilities, including those operated by Regulux, Europropulsion, Air Liquide Spatial Guyane and ArianeGroup - all participating in the production of Ariane 5 components. A total of 40 European manufacturers and local companies are involved in the launcher operations.

Europe's commitment to independent access to space is based on actions by three key players: the European Space Agency (ESA), the French CNES space agency and Arianespace. ESA is responsible for the Ariane, Soyuz and Vega development programs. Once these launch systems are qualified, ESA transfers responsibility to Arianespace as the operator. ESA has helped change the role of the Guiana Space Center, in particular by funding the construction of the launch complexes, payload processing buildings and associated facilities. Initially used for the France's space program, the Guiana Space Center has evolved into Europe's own Spaceport, according to the terms of an agreement between ESA and the French government. To ensure that the Spaceport is available for its programs, ESA takes charge of the lion's share of the CNES/CSG fixed expenses, and also helps finance the fixed costs for the ELA launch complexes.

The French CNES space agency has several main responsibilities at the Guiana Space Center. It designs all infrastructure and, on behalf of the French government, is responsible for safety and security. It provides the resources needed to prepare the satellites and launchers for missions. Whether during tests or actual launches, CNES is also responsible for overall coordination of operations and it collects and processes all data transmitted from the launcher via a network of receiving stations to track Ariane, Soyuz and Vega rockets throughout their trajectories.

ARIANESPACE IN FRENCH GUIANA

In French Guiana, Arianespace is the contracting authority in charge of operating the family of three launchers: Ariane, Soyuz and Vega.

Arianespace supervises the integration and checks of the Ariane launcher – which is built under ArianeGroup responsibility as the production prime contractor; coordinates the satellite preparations that are performed in parallel inside the Payload Preparation Complex (EPCU) [which is operated by the Guiana Space Center – CNES/CSG], followed by the payload's integration on the launcher in the Final Assembly Building (BAF); and also works with ArianeGroup teams in charge of the launcher to conduct the final countdown and launch from Launch Control Center no. 3 (CDL3).

Arianespace deploys a top-flight team and technical facilities to ensure the launchers and their satellite payloads are ready for their mission. Building on this unrivalled expertise and outstanding local facilities, Arianespace is now the undisputed benchmark in the global launch services market.
